# Are you using optimization?

The word “optimization” may be very familiar or may be quite new to you.

..... but whether you know about optimization or not, you are using optimization in many occasions of your day to day life .....

.....Examples.....

# Optimization in real life

Nest

# Example

A farmer has 2400 m of fencing and wants to fence off a rectangular field that borders a straight river. He needs no fence along the river. What are the dimensions of the field that has the largest area?

# Example

A manufacturer needs to make a cylindrical can that will hold 1.5 liters of liquid. Determine the dimensions of the can that will minimize the amount of material used in its construction.

$$\text{Minimize: } A = 2\pi r^2 + 2\pi r h$$

$$\text{Constraint: } \pi r^2 h = 1500$$

$$1.5 \text{ liters} = 1500 \text{ cm}^3$$

Dimension is in cm

# Example

## Objectives

Topology: Optimal connectivity of the structure

Minimum cost of material: optimal cross section of all the members

We will consider the second objective only

The design variables are the cross sectional area of the members, i.e.  $A_1$  to  $A_7$

Using symmetry of the structure  $A_7 = A_1, A_6 = A_2, A_5 = A_3$

You have only four design variables, i.e.,  $A_1$  to  $A_4$

# Optimization formulation

Objective

$$\text{Minimize } f = 1.132A_1l + 2A_2l + 1.789A_3l + 1.2A_4l$$

What are the constraints?

One essential constraint is non-negativity of design variables, i.e.

$$A_1, A_2, A_3, A_4 \geq 0$$

Is it complete now?

# Optimization formulation

Member	Force	Member	Force
AB	$-\frac{P}{2} \csc\theta$	BC	$+\frac{P}{2} \csc\alpha$
AC	$+\frac{P}{2} \cot\theta$	BD	$-\frac{P}{2} (\cot\theta + \cot\alpha)$

First set of constraints

$$\frac{P \csc\theta}{2A_1} \leq S_{yc}$$

$$\frac{P \cot\theta}{2A_2} \leq S_{yt}$$

$$\frac{P \csc\alpha}{2A_3} \leq S_{yt}$$

$$\frac{P}{2A_4} (\cot\theta + \cot\alpha) \leq S_{yc}$$

Another constraint is buckling of compression members

$$\frac{P}{2 \sin\theta} \leq \frac{\pi E A_1^2}{1.281 l^2}$$

$$\frac{P}{2} (\cot\theta + \cot\alpha) \leq \frac{\pi E A_4^2}{5.76 l^2}$$

Another constraint may be the minimization of deflection at C

$$\frac{Pl}{E} \left( \frac{0.566}{A_1} + \frac{0.500}{A_2} + \frac{2.236}{A_3} + \frac{2.700}{A_4} \right) \leq \delta_{max}$$

# Optimization formulation

$$\text{Minimize } f = 1.132A_1l + 2A_2l + 1.789A_3l + 1.2A_4l$$

Subject to

$$S_{yc} - \frac{Pcsc\theta}{2A_1} \geq 0$$

$$S_{yt} - \frac{Pcot\theta}{2A_2} \geq 0$$

$$S_{yt} - \frac{Pcsca}{2A_3} \geq 0$$

$$S_{yc} - \frac{P}{2A_4}(cot\theta + cota) \geq 0$$

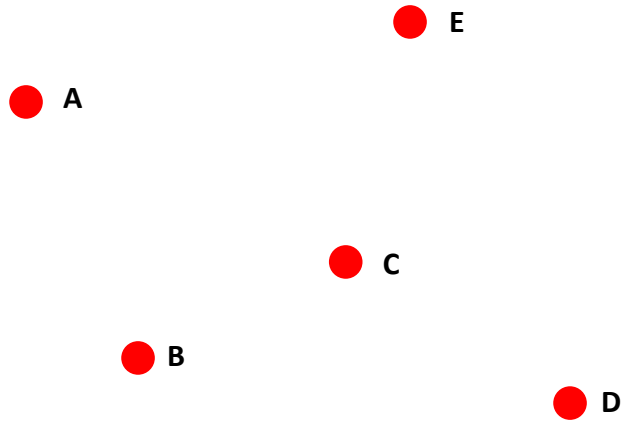

$$\frac{\pi EA_1^2}{1.281l^2} - \frac{P}{2\sin\theta} \geq 0$$

$$\frac{\pi EA_4^2}{5.76l^2} - \frac{P}{2}(cot\theta + cota) \geq 0$$

$$\delta_{max} - \frac{Pl}{E} \left( \frac{0.566}{A_1} + \frac{0.500}{A_2} + \frac{2.236}{A_3} + \frac{2.700}{A_4} \right) \geq 0$$

$$10 \times 10^{-6} \leq A_1, A_2, A_3, A_4 \leq 10 \times 10^{+6}$$

problem

# What is Optimization?

- Optimization is the act of obtaining the best result under a given circumstances.
- Optimization is the mathematical discipline which is concerned with finding the maxima and minima of functions, possibly subject to constraints.

# Introduction to optimization

$$f = (x - 5)^2$$

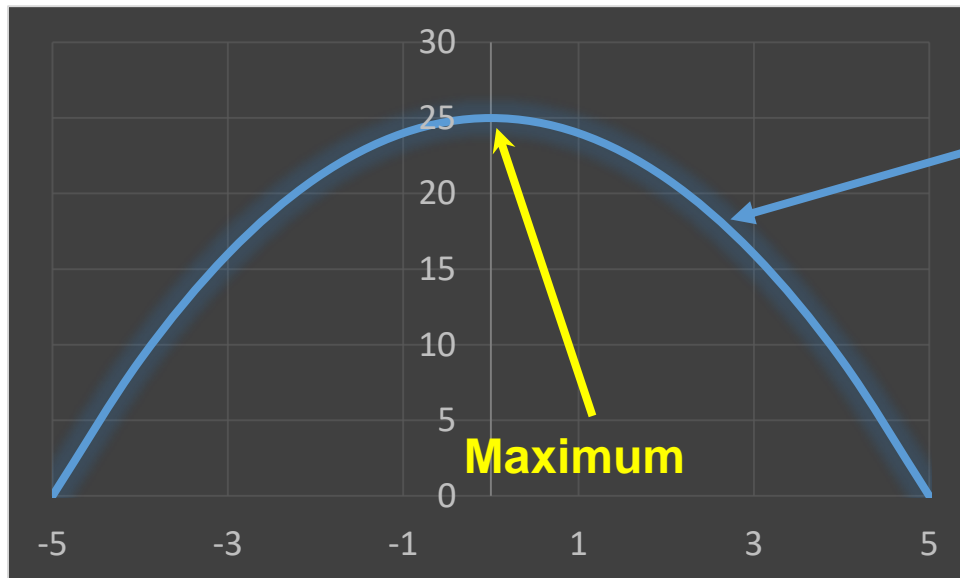

Equation of the line

How to find out the minimum of the function

$$f' = 2 \times (x - 5) = 0$$

$$x^* = 5$$

Optimal solution

$$f = 25 - x^2$$

Equation of the line

$$f' = 2x = 0$$

$$x^* = 0$$

Optimal solution

# Introduction to optimization

Optimal solution is  $(0,0)$

Equation of the surface

$$f(x,y) = -(x^2 + y^2) + 4$$

In this case, we can obtain the optimal solution by taking derivatives with respect to variable  $x$  and  $y$  and equating them to zero

$$\frac{\partial f}{\partial x} = -2x = 0 \quad \Rightarrow x^* = 0$$

$$\frac{\partial f}{\partial y} = -2y = 0 \quad \Rightarrow y^* = 0$$

# Single variable optimization

Objective function is defined as

Minimization/Maximization  $f(x)$

# Single variable optimization

## Stationary points

For a continuous and differentiable function  $f(x)$ , a *stationary point*  $x^*$  is a point at which the slope of the function is zero, i.e.  $f'(x) = 0$  at  $x = x^*$ ,

Minima

Maxima

Inflection point

# Global minimum and maximum

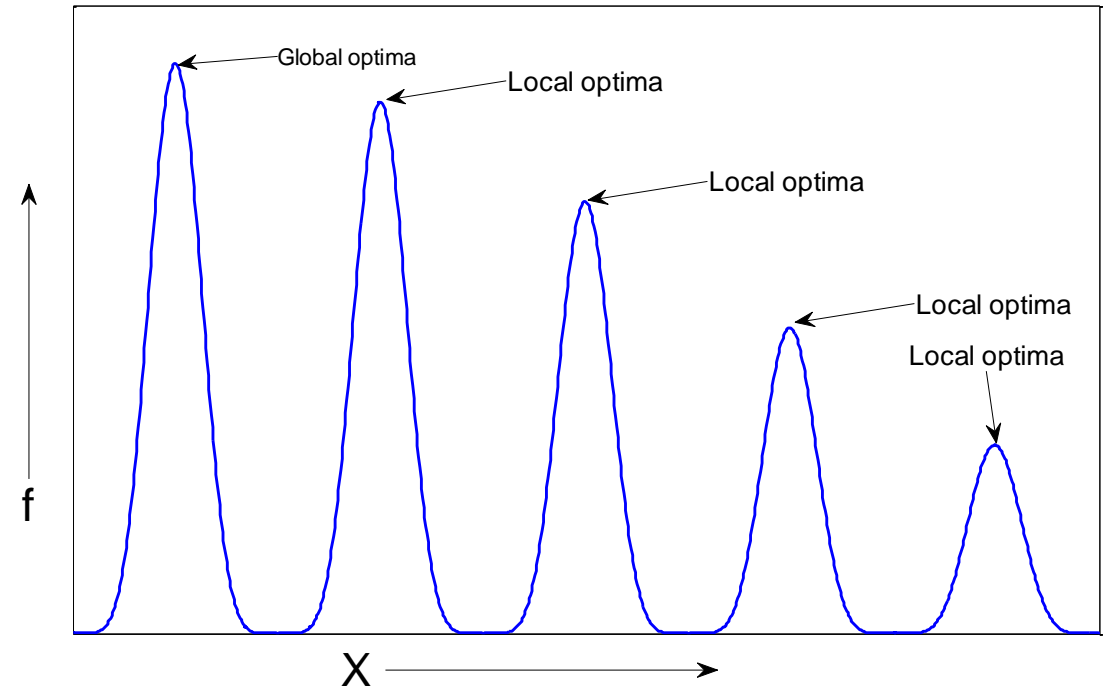

A function is said to have a *global or absolute minimum* at  $x = x^*$  if  $f(x^*) \leq f(x)$  for all  $x$  in the domain over which  $f(x)$  is defined.

A function is said to have a *global or absolute maximum* at  $x = x^*$  if  $f(x^*) \geq f(x)$  for all  $x$  in the domain over which  $f(x)$  is defined.

$A_1, A_2, A_3 =$  Relative maxima  
 $A_2 =$  Global maximum  
 $B_1, B_2 =$  Relative minima  
 $B_1 =$  Global minimum

# Introduction to optimization

# Necessary and sufficient conditions for optimality

## Necessary condition

If a function  $f(x)$  is defined in the interval  $a \leq x \leq b$  and has a relative minimum at  $x = x^*$ , Where  $a \leq x^* \leq b$  and if  $f'(x)$  exists as a finite number at  $x = x^*$ , then  $f'(x^*) = 0$

## Proof

$$f'(x^*) = \lim_{h \rightarrow 0} \frac{f(x^* + h) - f(x^*)}{h}$$

Since  $x^*$  is a relative minimum  $f(x^*) \leq f(x^* + h)$

For all values of  $h$  sufficiently close to zero, hence

$$\frac{f(x^* + h) - f(x^*)}{h} \geq 0 \quad \text{if } h \geq 0$$

$$\frac{f(x^* + h) - f(x^*)}{h} \leq 0 \quad \text{if } h \leq 0$$

# Necessary and sufficient conditions for optimality

Thus

$$f'(x^*) \geq 0 \quad \text{If } h \text{ tends to zero through +ve value}$$

$$f'(x^*) \leq 0 \quad \text{If } h \text{ tends to zero through -ve value}$$

Thus only way to satisfy both the conditions is to have

$$f'(x^*) = 0$$

Note:

- This theorem can be proved if  $x^*$  is a relative maximum
- Derivative must exist at  $x^*$
- The theorem does not say what happens if a minimum or maximum occurs at an end point of the interval of the function
- It may be an inflection point also.

## Sufficient condition

Suppose at point  $x^*$ , the first derivative is zero and first nonzero higher derivative is denoted by  $n$ , then

1. *If  $n$  is odd,  $x^*$  is an inflection point*

$$f'(x^*) = 0$$

2. *If  $n$  is even,  $x^*$  is a local optimum*

$$f''(x^*) = 0$$

✓ *If the derivative is positive,  $x^*$  is a local minimum*

$$f^3(x^*) = 0$$

✓ *If the derivative is negative,  $x^*$  is a local maximum*

$$f^4(x^*) = 0$$

$$f^n(x^*) \neq 0$$

# Sufficient conditions for optimality

## Proof

Apply Taylor's series

$$f(x^* + h) = f(x^*) + hf'(x^*) + \frac{h^2}{2!}f''(x^*) + \dots + \frac{h^{n-1}}{(n-1)!}f^{n-1}(x^*) + \frac{h^n}{n!}f^n(x^*)$$

Since  $f'(x^*) = f''(x^*) = \dots = f^{n-1}(x^*) = 0$

$$f(x^* + h) - f(x^*) = \frac{h^n}{n!}f^n(x^*)$$

When  $n$  is even  $\frac{h^n}{n!} \geq 0$

Thus if  $f^n(x^*)$  is positive  $f(x^* + h) - f(x^*)$  is positive Hence it is local minimum

Thus if  $f^n(x^*)$  negative  $f(x^* + h) - f(x^*)$  is negative Hence it is local maximum

When  $n$  is odd,  $\left(\frac{h^n}{n!}\right)$  changes sign with the change in the sign of  $h$ .

Hence it is an inflection point

# Sufficient conditions for optimality

Take an example

$$f(x) = x^3 - 10x - 2x^2 - 10$$

Apply necessary condition  $f'(x) = 3x^2 - 10 - 4x = 0$

Solving for  $x$   $x^* = 2.61$  and  $-1.28$       These two points are stationary points

Apply sufficient condition  $f''(x) = 6x - 4$

$f''(2.61) = 11.66$  *positive and  $n$  is even*     $f''(-1.28) = -11.68$  *negative and  $n$  is even*

$x^* = 2.61$  is a minimum point

$x^* = -1.28$  is a maximum point

# Multivariable optimization without constraints

Minimize  $f(X)$       Where  $X = \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}$

## Necessary condition for optimality

If  $f(X)$  has an extreme point (maximum or minimum) at  $X = X^*$  and if the first partial Derivatives of  $f(X)$  exists at  $X^*$ , then

$$\frac{\partial f(X^*)}{\partial x_1} = \frac{\partial f(X^*)}{\partial x_2} = \dots = \frac{\partial f(X^*)}{\partial x_n} = 0$$

# Multivariable optimization without constraints

## Sufficient condition for optimality

The sufficient condition for a stationary point  $X^*$  to be an extreme point is that the matrix of second partial derivatives of  $f(X)$  evaluated at  $X^*$  is

- (1) positive definite when  $X^*$  is a relative minimum
- (2) negative definite when  $X^*$  is a relative maximum
- (3) neither positive nor negative definite when  $X^*$  is neither a minimum nor a maximum

**Proof** Taylor series of two variable function

$$f(x + \Delta x, y + \Delta y) = f(x, y) + \Delta x \frac{\partial f}{\partial x} + \Delta y \frac{\partial f}{\partial y} + \frac{1}{2!} \left( \Delta x^2 \frac{\partial^2 f}{\partial x^2} + 2\Delta x \Delta y \frac{\partial^2 f}{\partial x \partial y} + \Delta y^2 \frac{\partial^2 f}{\partial y^2} \right) + \dots$$

$$f(x + \Delta x, y + \Delta y) = f(x, y) + [\Delta x \quad \Delta y] \begin{bmatrix} \frac{\partial f}{\partial x} \\ \frac{\partial f}{\partial y} \end{bmatrix} + \frac{1}{2!} [\Delta x \quad \Delta y] \begin{bmatrix} \frac{\partial^2 f}{\partial x^2} & \frac{\partial^2 f}{\partial x \partial y} \\ \frac{\partial^2 f}{\partial x \partial y} & \frac{\partial^2 f}{\partial y^2} \end{bmatrix} \begin{bmatrix} \Delta x \\ \Delta y \end{bmatrix} + \dots$$

# Multivariable optimization without constraints

$$f(X^* + h) = f(X^*) + h^T \nabla f(X^*) + \frac{1}{2!} h^T \mathbf{H} h + \dots$$

Since  $X^*$  is a stationary point, the necessary condition gives that  $\nabla f(X^*) = 0$

Thus

$$f(X^* + h) - f(X^*) = \frac{1}{2!} h^T \mathbf{H} h + \dots$$

Now,  $X^*$  will be a minima, if  $h^T \mathbf{H} h$  is positive

$X^*$  will be a maxima, if  $h^T \mathbf{H} h$  is negative

$h^T \mathbf{H} h$  will be positive if  $\mathbf{H}$  is a positive definite matrix

$h^T \mathbf{H} h$  will be negative if  $\mathbf{H}$  is a negative definite matrix

A matrix  $\mathbf{H}$  will be positive definite if all the eigenvalues are positive, *i.e.* all the  $\lambda$  values are positive which satisfies the following equation

$$|\mathbf{A} - \lambda \mathbf{I}| = 0$$

R.K. Bhattacharjya/CE/IITG

Another test

$$A_1 = |a_{11}|$$

$$A_2 = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix}$$

$$A_3 = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$A_n = \begin{vmatrix} a_{11} & a_{12} & a_{13} & a_{14} & \dots & a_{1n} \\ a_{21} & a_{22} & a_{23} & a_{24} & \dots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots & \dots & \vdots \\ a_{n1} & a_{n2} & a_{n3} & a_{n4} & \dots & a_{nn} \end{vmatrix}$$

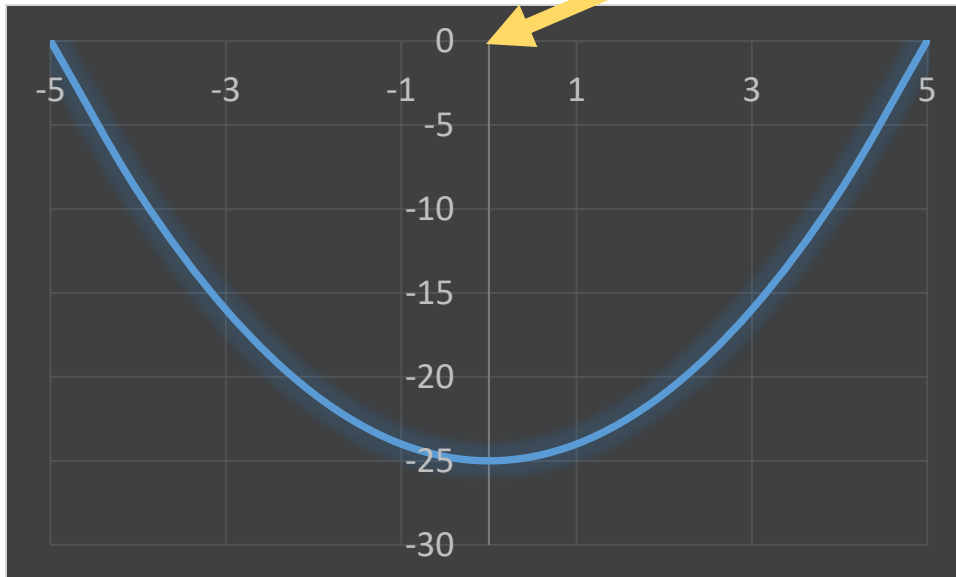

- ✓ A matrix  $\mathbf{A}$  will be positive definite if and only if all the values  $A_1, A_2, A_3, \dots, A_n$  are positive.
- ✓ The matrix will be negative definite if and only if the sign of  $A_j$  is  $(-1)^j$  for  $j = 1, 2, 3, \dots, n$

# Unimodal and duality principle

Optimal solution  $x^* = 0$

Optimal solution  $x^* = 0$

Minimization  $f(x) =$  Maximization  $-f(x)$

Thank you
